

Prerequisites for PiggyBankExpenseTracker

Project Overview:

This document details the necessary software libraries and hardware specifications required to run the **PiggyBankExpenseTracker** application. The project is built using a modular architecture that integrates secure data hashing, local database management, and native system notifications to provide a complete user experience.

Software Requirements:

Description	Comonent/Library	Category
The recommended IDE for viewing and running the source code	Visual studio Code	Development Environment
The core programming language used for development	Pyhon3.10	Language
The primary framework used for application logic and rendering	Kivy	GUI Framework
Material design components library for a modern user interface	KivyMD	UI Design
Backend library used for window management and OpenGL graphics	SDL2	Window Provider
A built-in serverless database engine for local data storage	SQLite3	Database
High-security hashing algorithm used for password encryption	Aragon2-cffi	Security
A library used to trigger Native system Notification	Plyer	Notification
Essential library for processing images and icons in kivyMD	Pillow	Image Handling

Note: Native notifications via **Plyer** depend on the operating system's notification center. Ensure that "Disturb Mode" is off during testing to see the notifications.

Hardware Requirements:

Recommended Requirements	Minimum Requirements	Component
Quad-core i5 or higher	Dual-core 2.0 GHz or equivalent	Processor (CPU)
4GB or higher	2GB	Memory (RAM)
Dedicated GPU or intel HD +Graphics 4000	OpenGL Es 2.0 compatible	Graphics (GPU)
500MB of free space	200MP of free space	Storage
1920X1080(Full HD)	1024x768 resolution	Display

Installation Command:

pip install kivy[base] kivymd pillow argon2-cffi plyer

This is fast command to help our supervisor to install library fast copy and paste it inside the terminal
